Press Release

## Astrel Group at the BePositive Fair in Lyon on solar PV systems and renewable resources

About all solutions dedicated to solar PV self-consumption and to smart home systems

**Astrel Group** will participate in the **Fair BePOSITIVE** in **Lyon** on **8th-10th March 2017**.

BePOSITIVE, suggesting in the name itself an optimistic approach, stands as an important reference for the fields of **renewable resources** and **energy saving**. Its keywords are solar PV systems, biomass heating and energy efficiency.

Astrel Group is pretty well-known in France already, due to the success of **4-noks products** on solar PV systems in recent years, and it will be present at the event with a dedicated stand presenting

its wide range of **solutions for optimizing solar PV energy self-consumption**. Moreover, visitors will see the **latest smart home systems for managing pellet and biomass heating** and for monitoring energy.

Among the solutions presented above, there will be also the **new Power Reducer 2.0**, in its **improved version**. Many users are already familiar with this device, which produces hot water using only solar PV energy, but its improvements include the management of **extended power**, the ability to **measure the self-consumed energy** and the **integrated temperature probe** with anti-frost function.

Hot water production and **e-mobility** will play a central role, with many positive examples of energy self-consumption with **Astrel Group technologies**.
